AVIRA COMMENCES FOLLOW-UP GROUND BASED EXPLORATION PROGRAM IN THE PATERSON RANGE

HIGHLIGHTS

- Data analysis and interpretation completed on initial exploration results.
- Priority 1 targets prospective for base metal sulphide mineralisation.
- Field crew mobilised to commence the second program of ground based exploration on priority 1 targets.
- Program consists of refined geological mapping, targeted geo-chem sampling and a ground based fixed and moving loop EM survey.
- Program designed to delineate priority RC drill targets in priority 1 areas.

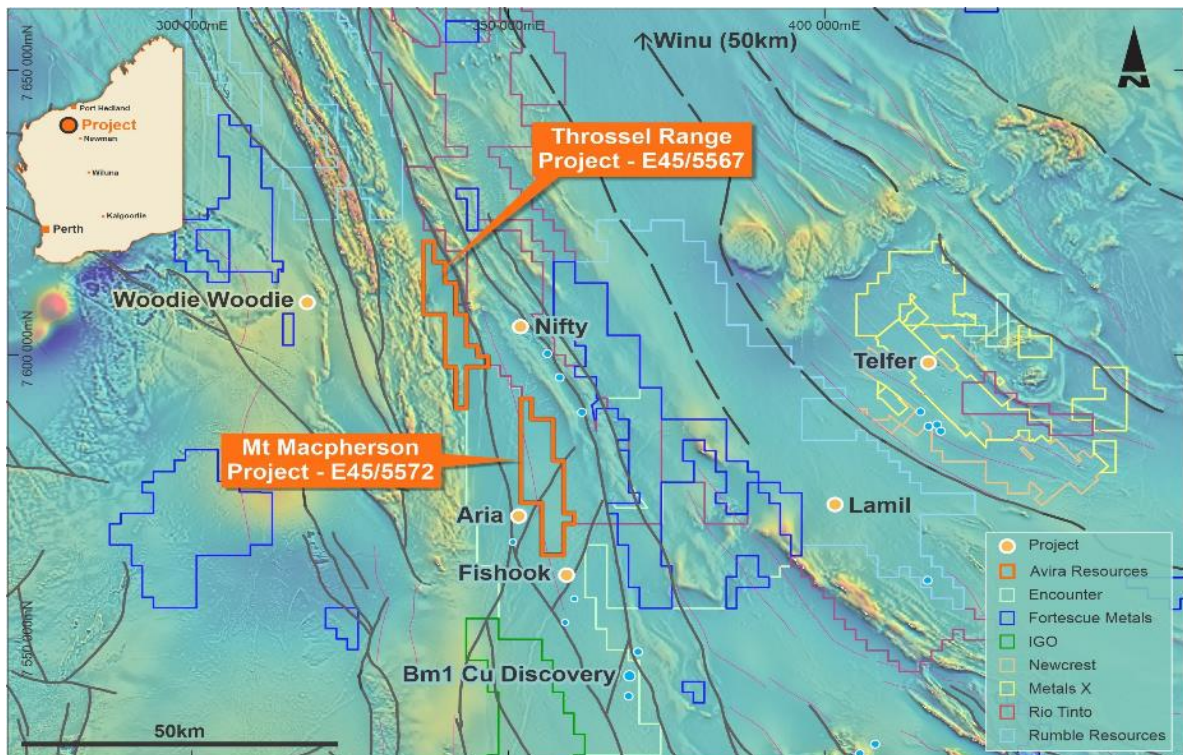

Figure 1. Location of Avira's Paterson Range projects

Avira Resources Limited (ASX: AVW) (**Avira** or the **Company**), advises that it has now completed analysis and interpretation of data collected from its most recent ground based and airborne exploration programs and has now mobilised a field team to complete the second phase of its planned ground based activities prior to commencement of anticipated drill program.

AVIRA RESOURCES
LIMITED

This second phase of ground based exploration is designed to delineate priority RC drill targets within the areas of interest. The program consists of refined geological mapping, targeted geo-chem sampling and a ground based fixed and moving loop EM survey based on results from the recently completed high-resolution helicopter borne Xcite™ electromagnetic and magnetic survey flown over both project areas.

The recent EM survey has significantly improved the resolution of magnetic data over the project and has highlighted a significant NE trending structural feature (Pipeline Target) on E45/5772 which has coincident mid to late time conductors and magnetic anomalism (figure 2).

The Pipeline Target is interpreted to be caused by magnetic and conductive minerals within a NE trending fault structure. The conductive mineral is thought to most likely be pyrrhotite a magnetic sulphide that can explain coincident magnetic and EM anomalies. Pyrrhotite is known to be associated with base metal sulphide mineralisation at other base metal prospects within the Paterson province and on this basis.

Avira considers that the Pipeline and Gwardar targets are prospective for base metal sulphide mineralisation.

Forward looking statements

This announcement contains forward-looking statements which are identified by words such as 'may', 'could', 'believes', 'estimates', 'targets', 'expects', or 'intends' and other similar words that involve risks and uncertainties. These statements are based on an assessment of present economic and operating conditions, and on a number of assumptions regarding future events and actions that, as at the date of this announcement, are expected to take place. Such forward-looking statements are not guarantees of future performance and involve known and unknown risks, uncertainties, assumptions and other important factors, many of which are beyond the control of the Company, the directors and our management. We cannot and do not give any assurance that the results, performance or achievements expressed or implied by the forward-looking statements contained in this prospectus will actually occur and investors are cautioned not to place undue reliance on these forward-looking statements. We have no intention to update or revise forward-looking statements, or to publish prospective financial information in the future, regardless of whether new information, future events or any other factors affect the information contained in this announcement, except where required by law. These forward looking statements are subject to various risk factors that could cause our actual results to differ materially from the results expressed or anticipated in these statements.

Competent Persons Statement

The information in this announcement that relates to Exploration Results is based on and fairly represents information and supporting documentation prepared by Mr Roland Gotthard. Mr Gotthard is a consultant geologist for AVW and a member of the Australian Institute of Mining and Metallurgy. Mr Gotthard has sufficient experience relevant to the styles of mineralisation and types of deposits which are covered in this announcement and to the activity which they are undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' ("JORC Code"). Mr Gotthard consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

About Avira Resources Limited

Avira Resources (AVW) is an ASX listed mining exploration company which currently holds two tenement packages within the Paterson Range province which is host to a number of substantial gold, copper and manganese mines and deposits, including the Telfer gold-copper mine. Subsequent significant recent discoveries made by Rio Tinto (Winu project) and the Newcrest-Greatland Gold JV (Havieron project) has reinvigorated interest in the province. The Avira projects are situated in the Yeneena basin sedimentary rock formation that hosts both the Nifty and Maroochydore copper deposits and the Woody Woody Manganese mine.

JORC CODE, 2012 EDITION

- SECTION 1 SAMPLING TECHNIQUES AND DATA (Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<ul style="list-style-type: none"> Sampling techniques 	<ul style="list-style-type: none"> Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to 	<ul style="list-style-type: none"> XCite airborne electromagnetic and magnetic survey The survey was conducted at a mean terrain clearance of 35 metres using a helicopter towed array transmitter/receiver loop. Magnetic data was captured using a magnetometer with a mean terrain clearance of 60 metres, and digital

Criteria	JORC Code explanation	Commentary
	<p>ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <ul style="list-style-type: none"> Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<p>elevation data collected. Line spacing was 200 metres.</p> <ul style="list-style-type: none"> Both Xcite surveys were flown with 200 metre line spacing on a bearing of 90° – 270°. The Throssel tenement survey consisted of 148 flight lines for a total of 608 km covering an area of approximately 100 km². The Mt. Macpherson tenement survey consisted of 139 lines for a total of 707 km covering an area of approximately 130 km² Soil samples were collected as 100-200g of +0.4mm/ -2mm
Drilling techniques	<ul style="list-style-type: none"> Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> N/A
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> N/A
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> N/A
<ul style="list-style-type: none"> Sub-sampling techniques and sample preparation 	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. 	<ul style="list-style-type: none"> Soil samples had duplicates performed every 20 samples in the field Soil samples appear to be appropriate to the material and regolith in the area Samples were analysed by AR10/MS 33 elements + Au method at Intertek Laboratories, Perth

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> Whether sample sizes are appropriate to the grain size of the material being sampled. 	
<ul style="list-style-type: none"> Quality of assay data and laboratory tests 	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	<ul style="list-style-type: none"> Standards, duplicates were inserted into soil sampling batches Insufficient QAQC data points exist for Certified Reference Materials submitted to the laboratory to ascertain laboratory performance on soil sampling batches at this stage Preliminary QAQC analysis indicates acceptable laboratory performance and acceptable field duplicate performance Xcite tm instrumentation
<ul style="list-style-type: none"> Verification of sampling and assaying 	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> Sample data was collected in the field in sampling booklets, with data entry into Excel spreadsheets Data was compiled into a MS Access relational database
<ul style="list-style-type: none"> Location of data points 	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Soil sampling was located in the field using hand held GPS units with an accuracy of +/- 3m Data was collected in Map Grid of of Australia 1994 zone 50 South Topographic control was via Sattelite Radar Tomographic Measurement (SRTM) 20m and Digital Elevation Model via heli EM survey collected with RTK GPS +/- 1m accuracy
<ul style="list-style-type: none"> Data spacing and distribution 	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Soil sample spacing is at a nominal 800m x 50m and is substantially incomplete at this time This spacing is considered insufficient to detect potential mineralisation over lengths less than 800m
